

Abstract

A connector (1) with a contact carrier (2) which has several receiving areas (9) for contact partners and a contact carrier sleeve (5) which can be moved over the contact carrier (2) and fixed there and which has a catch device (6) for locking the connector (1) to a mating connector. The invention providing that the contact carrier (2) and the contact carrier sleeve (5) are made symmetrical to each other such that the contact carrier sleeve (5) can be moved both into a first position and also into at least one second position over the contact carrier (2) and can be fixed in the selected position.
